

OPEN POSITION

AI Product Associate

LOCATION: Remote · Type: Contract · Division: Product /Engineering

SALARY

\$80 - \$200/hr

rate varies by project complexity and scope

EXPERIENCE

4-6 YRS

TRAVEL

<10%

START DATE

FLEXIBLE

About Blue Bison

Blue Bison Technology & Advisory works with virtue-forward organizations to deliver AI and machine-learning solutions. We believe technology should reinforce human judgment, not replace it.

The Role

- Blue Bison Tech sits at the intersection of AI consulting and product development. We build smart, practical tools for clients and ship SaaS products that solve real problems — and we're looking for a technically sharp generalist to help us do both.
- This is a project-based contract role** — you'll be engaged on a per-project basis as work comes in, not on a recurring retainer. Projects vary in scope and duration, and strong performers will be considered for future engagements as new work is scoped.
- As an AI Product Associate, you'll develop and iterate on AI-powered tools, work directly with LLM APIs, and contribute across the full lifecycle — from scoping to deployment. This is a hands-on builder role, not a strategy role, and it rewards curiosity, speed, and good judgment.

What You'll Do

- Build and ship AI-powered features and tools using Python and LLM APIs (OpenAI, Anthropic, Gemini, etc.)
- Design and iterate on prompts, pipelines, and agentic workflows
- Collaborate with consultants and clients to scope, prototype, and refine AI solutions
- Contribute to Blue Bison's internal SaaS products — from backend logic to lightweight front-end integrations
- Stay current with the fast-moving AI ecosystem and bring new tools and techniques to the team
- Document your work clearly so solutions are maintainable and extensible

What You Bring

- Proficiency in Python — you write clean, functional code without hand-holding
- Direct experience with major LLM APIs: OpenAI, Anthropic (Claude), Google Gemini, or similar
- Understanding of prompt engineering, context management, and retrieval-augmented generation (RAG)
- Comfort building and debugging integrations — REST APIs, webhooks, data pipelines
- Strong written communication — you can explain technical decisions to non-technical stakeholders
- Self-directed: you can manage your own work in a remote, async environment

Nice To Have

- Experience with Databricks, LangChain, LlamaIndex, or similar orchestration frameworks
- Familiarity with vector databases (Pinecone, Weaviate, Chroma)
- Exposure to no-code / low-code automation tools (n8n, Make, Zapier)
- Prior consulting, client services, or startup experience
- Basic front-end skills (React, Streamlit, or similar) for prototyping UIs

TECH STACK

Databricks · Python · Open AI API · Anthropic API · Gemini API · LangChain · RAG Pipelines · Vector DBs · Github · Streamlit · n8n

What We Offer

- Mission-aligned work: help organizations you actually care about
- Fully remote — work from anywhere in the US
- Flexible, project-based engagements — work fits around your schedule
- Direct exposure to cutting-edge AI projects across industries
- Small team, high ownership — your work ships and matters
- First-look priority on future projects for strong performers
- Opportunity to build a portfolio of real-world AI deployments
